

## **AMENDMENTS TO THE SPECIFICATION**

Please change the title of the application to read as follows:

Blow Molding ~~Method And~~ Machine For Producing Pasteurizable Containers

Please replace paragraph [0001] with the following paragraph:

[0001] This application is a divisional of United States Patent Application No. ~~09/395,708 filed on September 14, 1999~~ 6,485,669 issued on November 26, 2002.

The disclosure of the above application patent is incorporated herein by reference.

Please replace paragraph [0031] with the following paragraph:

[0031] The method of the present invention for producing a biaxially oriented, heat set plastic container having a sidewall with a high crystallinity generally includes a blow molding process and a heat setting process. The blow molding process includes providing a properly conditioned plastic preform 22 in the mold cavity 20 of the blow mold 12 and closing the blow mold 12. The plastic preform 22 is preferably made from PET, but may be made from other crystallizable materials. The blow core assembly 14 is next lowered into the plastic preform 22 such that a collar 33 of the blow seal is positioned interiorly of the finish or neck of the plastic preform 22 and a flange 37 engages the top of the plastic preform 22, as shown in FIG. 1. The stretch rod 16 is then moved by the pneumatic or hydraulic actuator from its retracted position to its extended position, as shown in FIG. 2. This extension of the stretch rod 16 into the plastic preform 22 axially stretches the sidewall 56 of the plastic preform 22, and triggers the start of the fluid cycle.

Please delete the Abstract Section of the specification and replace it with the following Abstract written in clean form.

A blow molding machine for producing a biaxially oriented, heat set plastic container, including a blow mold; a high-pressure fluid source; a high-temperature fluid source; a blow core assembly having an exhaust; and a controller coupled to the high-pressure fluid source, to the high-temperature fluid source, and to the exhaust. The PET containers produced by the machine have an average sidewall crystallinity greater than about 30%, which allows the PET container to maintain its material integrity during any subsequent pasteurization or retort process of the contents in the PET container, and during shipment of the PET container.
